# Statistical inference for structured models

Part IV: Estimation with bias sampling and proxy experiments. Large population models. Further models

Marc Hoffmann, Université Paris-Dauphine PSL

Spring school SFB 1294, March 2019

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

# Informal structure of the study

- Statistical setting: We have (i) data Z<sup>N</sup> and (ii) a parameter of interest f. Asymptotics are taken as N → ∞.
- Structure of the problem:

 $\mathcal{H}_N(Z^N) = 0$  for some SDE  $\mathcal{H}_N$ ,  $Z^N \to \xi$  limiting object,  $\mathcal{H}(\xi, f) = 0$  for some PDE  $\mathcal{H}$ .

• Objective: recover f from the observation of  $Z^N$  (or a proxy  $\mathcal{Z}^N$  of  $Z^N$ ).

# Today's program

- Bias sampling for growth-fragmentation models
  - Age model: many-to-one formulas.
  - Size models steady-state approximation.
- Human population models and nonlinear extensions
- Nonlinear models and open questions
  - Models of interacting neurons
  - More nonlinear models in a mean-field limit

#### **Bias sampling**

Age dependent model Size model: estimation at a large fixed time in a proxy model

Large population models

Nonlinear extensions, open questions Models of interacting neurons More non-linear models in a mean-field limit

# Age dependent division rate B(a)

The associated deterministic model is

$$\begin{cases} \partial_t g(t,a) + \partial_a g(t,a) + B(a)g(t,a) = 0\\ g(0,a) = g_0(a), \ g(t,0) = 2\int_0^\infty B(a)g(t,a)da. \end{cases}$$

• We are interested in recovering  $a \mapsto B(a)$  from data

$$(Z_t)_{0 \le t \le T}$$
 or  $Z_T$ 

- $Z_t = \sum_{i=1}^{N_t} \delta_{A_i(t)}$  with  $g(t, \cdot) = \mathbb{E}[Z_t^N]$ .
- Heuristically  $Z_T \approx g(T, \cdot)$  when T is large.

$$\blacktriangleright \ N = \mathbb{E}[\langle Z_T, \mathbf{1} \rangle] \to \infty \text{ as } T \to \infty.$$

#### Observation scheme

- We observe  $(Z_t)_{0 \le t \le T}$  or  $Z_T$ .
- ► Tree representation:

$$\begin{aligned} \mathcal{T}_{\mathcal{T}} &= \left\{ u \in \mathbb{T}, b_u \leq T \right\} = \mathring{\mathcal{T}}_{\mathcal{T}} \cup \partial \, \mathcal{T}_{\mathcal{T}}, \\ \mathring{\mathcal{T}}_{\mathcal{T}} &= \left\{ u \in \mathbb{T}, d_u \leq T \right\}, \\ \partial \, \mathcal{T}_{\mathcal{T}} &= \left\{ u \in \mathbb{T}, b_u \leq T < d_u \right\}. \end{aligned}$$

We have the correspondence

$$\begin{cases} (Z_t)_{0 \le t \le T} \leftrightarrow \{\zeta_u^T = \min(d_u, T) - b_u, u \in \mathcal{T}_T\}, \\ Z_T \leftrightarrow \{\zeta_u^T, u \in \partial \mathcal{T}_T\}. \end{cases}$$

- Additional difficulty: bias selection.
- ► Recovering strategy: many-to-one formulae.

# Observation schemes $\mathring{\mathcal{T}}_{\mathcal{T}} \cup \partial \mathcal{T}_{\mathcal{T}}$

Figure: A sample path of  $Z_t(da)_{0 \le t \le T}$  with  $B(a) = a^2$  and T = 7.

イロト イポト イヨト イヨト

# Estimation of B(a) from $\mathcal{T}_T$

• Many-to-one formula: For nice test functions  $\varphi$ :

$$\mathbb{E}\big[\sum_{u\in\mathring{\mathcal{T}}_{T}}\varphi(\zeta_{u})\big] = \int_{0}^{T} e^{\lambda_{B}s} \mathbb{E}\big[\varphi(\chi(s))H_{B}\big(\chi(s)\big)\big] ds$$

χ(t): a tagged branch picked at random on the tree.
 We have ℝ[|<sup>\*</sup>
 <sup>T</sup>
 <sup>T</sup>
 <sup>I</sup>
 <sup>C</sup>
 <sup>KB</sup>
 <sup>C</sup>
 <sup>KB</sup>
 <sup>C</sup>
 <sup>KB</sup>
 <sup>KB</sup>
 <sup>C</sup>
 <sup>KB</sup>
 <sup>KB</sup>

 $N = N_B \approx e^{\lambda_B T}$  depends on *B* itself!

- $\lambda_B$ : Malthus parameter, related to  $\chi$  and  $H_B$ .
- $H_B(a)$  explicit:  $f_{H_B}(a) = 2e^{-\lambda_B a} f_B(a)$ .
- We have all the ingredients needed for a law of large numbers.

# Estimation of B(a) from $\mathcal{T}_T$

• 
$$f_B(a) = B(a) \exp\left(-\int_0^\infty B(s) ds\right).$$

Law of large numbers

$$\frac{1}{|\mathring{\mathcal{T}}_{\mathcal{T}}|}\sum_{u\in\mathring{\mathcal{T}}_{\mathcal{T}}}\varphi(\zeta_u)\stackrel{\mathbb{P}}{\to}\int_0^{\infty}\varphi(a)2e^{\lambda_Ba}f_B(a)da$$

- Rate of convergence:  $(e^{\lambda_B T})^{1/2} = N^{1/2}$  in probability.
- Rate heavily parameter dependent.
- Proof: establish rates of convergence in the many-to-one formula for test functions on forks φ(ζ<sub>u</sub>, ζ<sub>v</sub>) for u, v ∈ T
  <sup>\*</sup><sub>T</sub> + geometric ergodicity.
- We meet the same difficulties as for BMC models.

# Estimation of B(a) from $\mathcal{T}_T$

- We can find a fast converging preliminary estimator  $\hat{\lambda}_T$  of  $\lambda_B$ .
- Set

$$\widehat{B}_{h}^{T}(a) = \frac{|\mathring{\mathcal{T}}_{T}|^{-1} \sum_{u \in \mathring{\mathcal{T}}_{T}} \frac{1}{2} e^{\widehat{\lambda}_{T} \zeta_{u}} K_{h}(a - \zeta_{u})}{1 - |\mathring{\mathcal{T}}_{T}|^{-1} \sum_{u \in \mathring{\mathcal{T}}_{T}} \frac{1}{2} e^{\widehat{\lambda}_{T} \zeta_{u}} \mathbf{1}_{\{\zeta_{u} \leq a\}}}$$

For 
$$h = \hat{h}^T(\alpha) = (\exp(\hat{\lambda}T))^{-1/(2\alpha+1)}$$
, we have the weak boundedness of

$$N^{lpha/(2lpha+1)}\Big(\widehat{B}^T_{\widehat{h}^T(lpha)}(a) - B(a)\Big)$$

uniformly over  $\mathcal{B} \cap \mathcal{H}^{\alpha}$  for appropriate  $\mathcal{B}$ .

- The rate is nearly minimax.
- Open problem: we do not have adaptation, for lack of concentration inequalities.

# What if data are taken from $\partial T_T$ solely?

By another many-to-one formula, we have for good test functions φ

$$\begin{aligned} |\partial \mathcal{T}_{\mathcal{T}}|^{-1} \sum_{u \in \partial \mathcal{T}_{\mathcal{T}}} \varphi(\zeta_u) \xrightarrow{\mathbb{P}} 2\lambda_B \int_0^\infty \varphi(a) e^{\lambda_B a} \frac{f_B(a)}{B(a)} da \\ &= 2\lambda_B \int_0^\infty \varphi(a) e^{\lambda_B a} e^{-\int_0^a B(s) ds} da. \end{aligned}$$

- We still have a  $N^{1/2}$ -rate of convergence (in probability).
- We retrieve an ill-posed problem of order 1, leading to convergence rate

$$N_B^{lpha/(2lpha+3)}$$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

but not  $N^{\alpha/(2\alpha+1)!}$ .

## The age dependent model, simulated data

Figure: Reconstruction of B over  $\mathcal{D} = [0.1, 4]$  with 95%-level confidence bands constructed over M = 100 Monte-Carlo trees. In bold red line:  $x \rightsquigarrow B(x)$ ; in bold blue line:  $f_{H_B}$ ; in blue line:  $f_B$ . Left: T = 15. Right: T = 23.

(日) (同) (日) (日)

# Size dependent division rate B(x)

The associated deterministic model is

$$\begin{cases} \partial_t g(t,x) + \partial_x (\kappa(x)g(t,x)) + B(x)g(t,x) = 4B(2x)g(t,2x) \\ g(0,x) = g_0(x), \ g(t,0) = 0. \end{cases}$$

• We are interested in recovering  $x \mapsto B(x)$  from terminal data

$$Z_T \longleftrightarrow \partial \mathcal{T}_T$$
 solely.

• 
$$Z_t = \sum_{i=1}^{N_t} \delta_{X_i(t)}$$
 with  $g(t, \cdot) = \mathbb{E}[Z_t^N]$ .

• Heuristically  $Z_T \approx g(T, \cdot)$  when T is large.

$$\blacktriangleright \ N = \mathbb{E}[\langle Z_T, \mathbf{1} \rangle] \to \infty \text{ as } T \to \infty.$$

This is too difficult!

Alternate strategy: "if the data don't fit, change the data!"

- Represent the solution of the transport-fragmentation equation in a stationary regime.
- Obtain a reconstruction formula for B(x) via this representation in terms of the steady-state or stationary density of the model.
- Postulate a proxy model where one observes exactly a drawn from the stationary density.
- Transfer standard nonparametric estimation techniques in this setting.

# Solution by stable distribution

• Start with the transport-fragmentation equation  $(\kappa(x) = \tau x)$ 

$$\partial_t g(t,x) + \partial_x (\tau x g(t,x)) + B(x)g(t,x) = 4B(2x)g(t,2x)$$

• Ansatz:  $g(t, x) = e^{\lambda t} N(x)$  ( $\lambda = \lambda_B$ : Malthus parameter).

$$\partial_x(\tau x N(x)) + (\lambda + B(x))N(x) = 4B(2x)N(2x)$$

- ► Steady-state approximation:  $g(T, x) \approx e^{\lambda T} N(x)$  when  $T \rightarrow \infty$  with explicit (fast) rates of convergence.
- Interpretation: N(x) stationary size distribution of a cell in a stationary regime.

## A proxy statistical model

- > Yields a strategy for the nonparametric estimation of *B*:
  - 1. Extract from  $Z_T$  a "sample"  $X_1, \ldots, X_n$  of cell sizes.
  - 2. Postulate the approximation

$$\mathbb{P}(X_1 \in dx_1, \ldots, X_n \in dx_n) \approx \otimes_{i=1}^n N(x_i) dx_i.$$

If  $n \to \infty$  but  $n \ll N$ , hope for a chaos propagation property.

3. Recover *B* through the representation

$$L(N) = \mathfrak{L}(BN),$$

or

$$B=\frac{\mathfrak{L}^{-1}L(N)}{N}$$

with

$$L(\varphi)(x) = \partial_x (\tau x \varphi(x)) + \lambda \varphi(x),$$
  
 $\mathfrak{L}(\varphi)(x) = 4\varphi(2x) - \varphi(x).$ 

► The operator L(·) has ill-posedness degree of order 1. The operator L is "nicer".

# Growth-fragmentation: a word of conclusion

data	Size model	Age model
proxy model	$n^{-\alpha/(2\alpha+3)}$ + adaptation	irrelevant
$\partial \mathcal{T}_T$	?	$(e^{\lambda_B T})^{-lpha/(2lpha+3)}$
genealogical	$n^{-lpha/(2lpha+1)}$ + adaptation	$n^{-lpha/(2lpha+1)}$ + adaptation
$\mathring{T}_T$	?	$(e^{\lambda_B T})^{-lpha/(2lpha+1)}$

<□ > < @ > < E > < E > E のQ @

Age dependent model Size model: estimation at a large fixed time in a proxy model

#### Large population models

Nonlinear extensions, open questions Models of interacting neurons More non-linear models in a mean-field limit

# Construction of the microscopic model

- ▶  $b, \mu : \mathbb{R}_+ \times \mathbb{R}_+ \to \mathbb{R}_+$  model parameters.
- b(t, a): fertility rate of the population with age a at time t.
   μ(t, a): mortality rate of the population with age a at time t.
- ► Z<sub>0</sub> random variable with value in M<sub>F</sub>, the set of finite point measures on ℝ<sub>+</sub>: initial age distribution of the population at time t = 0.

## Microscopic evolution equation

• Evolution equation for  $t \in [0, T]$ :

$$Z_t^N = \tau_t Z_0^N$$
  
+  $N^{-1} \int_0^t \sum_{i \le \langle Z_{s-}^N, \mathbf{1} \rangle} \int_{0 \le \theta \le b(s, a_i(Z_{s-}^N))} \delta_{t-s}(da) Q_1(ds, di, d\theta)$   
-  $N^{-1} \int_0^t \sum_{i \le \langle Z_{s-}^N, \mathbf{1} \rangle} \int_{0 \le \theta \le \mu(s, a_i(Z_{s-}^N))} \delta_{a_i(Z_{s-})+t-s}(da) Q_2(ds, di, d\theta)$ 

•  $Q_i$ : two independent random Poisson measures on  $\mathbb{R}_+ \times \mathbb{N} \times \mathbb{R}_+$  with intensity  $dt(\sum_{k>1} \delta_k(di))d\theta$ .

# Microscopic evolution equation

(日)、

э

Figure: Left: Sample path of  $NZ_0^N(da)$  with N = 3 and its evolution without births. Right: Sample path of  $(NZ_t^N(da), t \in [0, T])$ .

#### Large population limit

- $N \to \infty$  abstract asymptotic parameter.
- ▶ Reminiscent of a population size : (NZ<sup>N</sup><sub>t</sub>, 1) ≈ N for every t ∈ [0, T].
- T is fixed throughout!
- If  $Z_0^N \approx g_0(a)da$ , then  $Z_t^N(da) \approx \xi_t(da) = g(t,a)da$ .
- ► g(t, a) weak solution to the McKendrick & Von Foerster equation

$$\begin{cases} \frac{\partial}{\partial t}g(t,a) + \frac{\partial}{\partial a}g(t,a) + \mu(t,a)g(t,a) = 0, \\ g(0,a) = g_0(a), \ g(t,0) = \int_{\mathbb{R}_+} b(t,a)g(t,a)da. \end{cases}$$

# Identifiability of the parameters

- Under a suitable approximation  $Z_0^N \approx \phi \rightsquigarrow$  identification of  $\phi$ .
- ▶ Need to understand how  $Z_0^N \approx \phi$  propagates to  $Z_t^N \approx g(t, \cdot)$  for  $t \in [0, T]$ .
- ► Claim: Under "suitable propagation", we can identify g from Z<sup>N</sup>.
- Claim: Likewise, we can identify  $\mu$  from  $Z^N$ .
- We *cannot* identify *b* from  $Z^N$  for lack of injectivity of  $b \mapsto g$ .

## First estimators

- Statistical objective: estimate g(t, a) and µ(t, a) from data (Z<sup>N</sup><sub>t</sub>, t ∈ [0, T]).
- ▶ First kernel estimator of g(t, a):

$$\widehat{g}_{h}^{\text{prel}}(t,a) = \int_{0}^{T} \int_{\mathbb{R}_{+}} K_{h}(t-s,a-u) Z_{s}^{N}(du).$$

► We will see that both bias and variance of g<sup>pre1</sup><sub>h</sub>(t, a) behave poorly!

# First estimator of the mortality rate $\mu$

• Extract from  $Z^N$  the mortality process

$$\Gamma^N(dt, da) = \sum_{k\geq 1} \delta_{(T^N_k, A^N_k)},$$

 $(T_k^N, A_k^N) =$ (time of death, age at death) of the *k*-th occurence of mortality.

• First kernel estimator of  $\mu$ :

$$\widehat{\mu}_{\boldsymbol{h}}^{\texttt{prel}}(t, \boldsymbol{a}) = \frac{\int_{0}^{T} \int_{\mathbb{R}_{+}} K_{\boldsymbol{h}}(t-s, \boldsymbol{a}-u) \Gamma^{N}(ds, du)}{\widehat{g}(t, \boldsymbol{a})}$$

given an estimator of g(t, a) of  $\hat{g}(t, a)$ .

bias of µ̂<sup>prel</sup><sub>h</sub>(t, a) behaves poorly + inherits of the possible defects of ĝ(t, a).

# Hölder regularity of the limit

Look for the regularity of g as the solution of the Mc Kendrick & Von Foerster equation:

$$egin{aligned} &rac{\partial}{\partial t}g(t,a)+rac{\partial}{\partial a}g(t,a)+\mu(t,a)g(t,a)=0\ &g(0,a)=\phi(a),\ g(t,0)=\int_{\mathbb{R}_+}b(t,a)g(t,a)da. \end{aligned}$$

► Assumption:  $b \in \mathcal{H}^{\alpha,\beta}, \mu \in \mathcal{H}^{\gamma,\delta}, \phi \in \mathcal{H}^{\nu}$  for some  $\alpha > 0, \beta > 0, \gamma > 0, \delta > 0, \nu \gg 1.$ 

Theorem
 We have

$$g\mathbf{1}_{\{\boldsymbol{a} < t\}} \in \mathcal{H}^{\min(\alpha,\beta,\gamma+1,\delta),\min(\alpha,\beta,\gamma+1,\delta)}$$

and

$$g\mathbf{1}_{\{a>t\}} \in \mathcal{H}^{\min(\gamma+1,\delta),\max(\min(\gamma,\delta+1),\delta)}$$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

and

$$\widetilde{g}(t,a')\mathbf{1}_{\{a'<0\}}\in\mathcal{H}^{\min(\gamma+1,\delta+1),\max(\min(\gamma,\delta+1),\delta)}$$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

# Reconstruction of g

• Estimate g on  $\mathcal{D}_U = \{(t, a) \in (0, T) \times (0, a_{\max}), t < a\}$  and  $\mathcal{D}_L = \{(t, a), 0 < a < t < T\}$  separately.

$$\widehat{g}_{h}^{\text{prel}}(t,a) = \int_{0}^{T} \int_{\mathbb{R}_{+}} \mathcal{K}_{h}(t-s,a-u) Z_{s}^{N}(du) ds.$$

► We estimate g(t, a) in the direction suggested by g̃(t, a) in order to benefit from its smoothness:

$$\widehat{g}_{N,h}^{\text{inter}}(t,a) = \int_0^T \int_{\mathbb{R}_+} K_h(t-s,(t-s)-(a-u)) Z_s^N(du) ds.$$

# Reconstruction of d via $\widehat{g}_{N,h}$ and the process $\Gamma^N$

We also estimate µ(t, a) = µ(t, a)g(t, a)/g(t, a) in the direction suggested by g̃(t, a):

$$\widehat{\mu}_{N,\boldsymbol{h},\boldsymbol{h}'}^{\text{inter}}(t,a) = \frac{\int_0^T \int_{\mathbb{R}_+} K_{\boldsymbol{h}}(t-s,(t-s)-(a-u)) \Gamma_s^N(du)}{\widehat{g}_{N,\boldsymbol{h}}^{\text{inter}}(t,a)}.$$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

# Stochastic error analysis for g

• We now look for a control  $g_h(t, a) \approx \widehat{g}_{N,h}^{\text{inter}}(t, a)$ , with

$$g_{\boldsymbol{h}}(t,a) = \int_0^T \int_{\mathbb{R}_+} K_{\boldsymbol{h}}(t-s,(t-s)-(a-u)) g(s,u) du ds.$$

We have

$$\widehat{g}_{N,oldsymbol{h}}^{ ext{inter}}(t,oldsymbol{a}) = \int_0^T \int_{\mathbb{R}_+} \mathcal{K}_{oldsymbol{h}}ig(t-oldsymbol{s},(t-oldsymbol{s})-(oldsymbol{a}-oldsymbol{u})ig) Z_s^{oldsymbol{N}}(doldsymbol{u})doldsymbol{s}$$

We need

$$Z^{\sf N}_{s}(du)dspprox g(s,u)duds$$

in an appropriate sense (related to  $K_h$ ) as  $N \to \infty$ .

## Toward a coherence property

- How does a suitable assumption on dist(Z<sub>0</sub><sup>N</sup>, ξ<sub>0</sub>) propagates to dist(Z<sub>t</sub><sup>N</sup>, ξ<sub>t</sub>) as N → ∞? For which dist(·, ·)? (coherence)
- Introduce a pseudo-distance related to a weight function ψ ∈ L<sup>∞</sup>(ℝ). For a suitable class of functions F let

$$\mathbb{W}_\psi(\mu,
u) = \sup_{arphi \in \mathcal{F}} \Big| \int_{\mathbb{R}_+} \psi(a) arphi(a) ig(\mu(da) - 
u(da)ig) \Big| \, .$$

► For instance, if *F* consists of 1-Lipschitz functions, reminiscent of a weighted Wasserstein-1 distance in the degenerate case ψ = 1.

# Toward a coherence property

- Assume  $\mathbb{W}_{\psi}(Z_0^N,\xi_0) \lesssim w_N$  for some (small)  $w_N$ .
- Seek a bound of the form

$$\mathbb{W}_{\psi(?)}(Z_t^N,\xi_t) \stackrel{P}{\lesssim} w_N + \delta_N$$
 for  $t \in [0,T]$ 

for some (small)  $\delta_N$  that controls the error propagation. For  $\delta_N \lesssim w_N$ , we say that we have a coherence property.

# Toward a coherence property

#### • Assumption: (Initial approximation): For some $p \ge 2$

$$\mathbb{E}\Big[\mathbb{W}_{\psi}\big(Z_{0}^{N},\xi_{0}\big)^{p}\Big] \lesssim |\psi|_{\infty}^{p/2}|\psi|_{1}^{p/2}w_{N}^{p}$$

with  $w_N \to 0$  as  $N \to \infty$ . • If  $Z_0^N = N^{-1} \sum_{i=1}^N \delta_{A_i}$  for IID  $A_i$ , we expect  $w_N \approx N^{-1/2}$ .

# Coherence property

- *N*(*F*, | · |<sub>∞</sub>, ϵ) minimal number of ϵ-balls in | · |<sub>∞</sub> norm necessary to cover *F*.
- Assume: ∫<sub>0</sub><sup>1</sup> log (1 + N(F, | · |<sub>∞</sub>, ε)) dε < ∞ + 'some' stability for F.</p>

# Theorem (Coherence property) We have for all $t \in [0, T]$

$$\mathbb{E}\Big[\mathbb{W}_{\psi(t-\cdot)}(Z_t^N,\xi_t)^p\Big] \lesssim |\psi|_{\infty}^{p/2} |\psi|_1^{p/2} w_N^p \vee N^{-p/2}$$

# Stochastic error analysis for g

► With 
$$G = K^{(1)}(\cdot - t)$$
 and  $H = K^{(2)}(\cdot - (t - a))$ :  
 $|\widehat{g}_{N,h}(t,a) - g_{h}(t,a)|$   
 $= |\int_{0}^{T} G_{h_{1}}(s) \int_{\mathbb{R}_{+}} H_{h_{2}}(s - u)(Z_{s}^{N}(du) - g(s, u))ds|$   
 $\leq \int_{0}^{T} |G_{h_{1}}(s)| \mathbb{W}_{H_{h_{2}}(s - \cdot)}(Z_{s}^{N}, \xi_{s})ds$ 

▶ Using the coherence property we get  $\forall (t, a) \in D_L \cup D_U$ 

$$\mathbb{E}\left[\left|\widehat{g}_{N,h}(t,a) - g_{h}(t,a)\right|^{2}\right] \lesssim w_{N}^{2} \vee N^{-1} \frac{|K^{(1)}|_{2}^{2}|K^{(2)}|_{\infty}|K^{(2)}|_{1}}{h_{1}h_{2}}$$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Appended with the previous bias control

#### Convergence rates

• Anisotropic rate  $v(t, a)^{-1}$ 

$$= \begin{cases} \min(\gamma+1,\delta+1)^{-1} + (\min(\alpha,\beta,\gamma+1,\delta)^{-1} & \text{on } \mathcal{D}_L(t,a) \\ \min(\gamma+1,\delta+1)^{-1} + (\max(\min(\gamma,\delta+1),\delta)^{-1} & \text{on } \mathcal{D}_U(t,a). \end{cases}$$

#### Theorem We have for pointwise (non-adaptive) optimisation of **h**:

 $\sup_{b,\mu,\phi,(t,a)} \mathbb{E}\big[\big(\widehat{g}_{N,\boldsymbol{h}}^{\text{inter}}(t,a) - g(t,a)\big)^2\big] \lesssim (w_N^2 \vee N^{-1})^{2\nu(t,a)/(2\nu(t,a)+1)}.$ 

- Supremum in (t, a) over compacts of D<sub>L</sub> ∪ D<sub>U</sub> and in (b, µ, φ) over (balls) of Hölder classes
- This result is not optimal!

# Optimal estimation of g (and subsequently $\mu$ )

- The stochastic error for  $\widehat{g}_{N,h}^{\text{inter}}$  is stable as  $h_1 \rightarrow 0!$
- G<sub>h1</sub>(t − ·) = G<sub>h1=0</sub>(t − ·) = δ<sub>t</sub> works! Estimating g(t, ·) is a univariate problem, for each t ∈ [0, T].
- This is no longer true for statistics based on Γ<sup>N</sup>(dt, da): need a bivariate anisotropic estimator for estimating μ(t, a) together with a choice of direction dictated by ğ.
- Final estimators

$$\widehat{g}_{N,h}^{fin}(t,a) = \int_{\mathbb{R}_+} K_h(a-u) Z_t^N(du)$$

and

$$\widehat{\mu}_{N,\boldsymbol{h},\boldsymbol{h}}^{\text{fin}}(t,a) = \frac{\int_{0}^{T} \int_{\mathbb{R}_{+}} \mathcal{K}_{\boldsymbol{h}}(t-s,(t-s)-(a-u)) \Gamma_{s}^{N}(du)}{\widehat{g}_{N,\boldsymbol{h}}^{\text{fin}}(t,a)}.$$

# Convergence rates for $\hat{g}_{n,h}^{\text{fin}}$

Our (univariate) rate estimation for g:

 $v_1^{\star}(t, a) = \min\{\alpha, \beta, \gamma+1, \delta\} \mathbf{1}_{\mathcal{D}_L(t, a)} + \max(\min(\gamma, \delta+1), \delta) \mathbf{1}_{\mathcal{D}_U(t, a)}.$ 

#### Theorem

We have,  $\forall (t, a) \in \mathcal{D}_L \cup \mathcal{D}_U$ , for pointwise (non-adaptive) optimisation of **h**:

$$\sup_{b,\mu,\phi,(t,a)} \mathbb{E}\big[\big(\widehat{g}_{N,h}^{\text{fin}}(t,a) - g(t,a)\big)^2\big] \lesssim (w_N^2 \vee N^{-1})^{2v_1^\star(t,a)/(2v_1^\star(t,a)+1)}.$$

- Minimax lower bound:  $N^{-2\min(\gamma,\delta)/(2\min(\gamma,\delta)+1)}$ .
- Minimax optimality: on  $\mathcal{D}_U$  if  $\delta \leq \gamma \leq \delta + 1$  and on  $\mathcal{D}_L$  if  $\delta 1 \leq \gamma \leq \delta$  and  $\delta \geq \gamma$ .

Convergence rates for  $\widehat{\mu}_{N,\boldsymbol{h},h}^{\text{fin}}$ 

• Our (bivariate) rate estimation for  $\mu$ :  $v_2^*(t, a)$ 

$$= \begin{cases} \min(\gamma, \delta)^{-1} + \min(\alpha, \beta, \gamma + 1, \delta)^{-1} & \text{on } \mathcal{D}_L \\ \min(\gamma, \delta)^{-1} + \delta^{-1} & \text{on } \mathcal{D}_U. \end{cases}$$

#### Theorem

We have,  $\forall (t, a) \in \mathcal{D}_L \cup \mathcal{D}_U$ , for pointwise (non-adaptive) optimisation of **h**:

$$\sup_{b,\mu,\phi,(t,a)} \mathbb{E}\big[\big(\widehat{\mu}_{N,\boldsymbol{h},\boldsymbol{h}}^{\mathtt{fin}}(t,a) - \mu(t,a)\big)^2\big] \lesssim (w_N^2 \vee N^{-1})^{2v_2^\star(t,a)/(2v_2^\star(t,a)+1)}$$

- Minimax lower bound:  $N^{-2s(\gamma,\delta)/(2s(\gamma,\delta)+1)}$  with  $s(\gamma,\delta)^{-1} = \gamma^{-1} + \delta^{-1}$ .
- Minimax optimality: If  $\gamma \leq \delta$  on  $\mathcal{D}_U$  and if  $\gamma \leq \delta \leq \gamma + 1$  on  $\mathcal{D}_L$ .

### Toward smoothness adaptation

Let  

$$\mathbb{W}_{\psi}(\xi, \zeta) = \sup_{\varphi \in \mathcal{F}} \left| \int_{0}^{T} \int_{\mathbb{R}_{+}} \psi(s, s-u) \varphi(s, u) (\xi_{s}(du) - \zeta_{s}(du)) \right| ds.$$

#### Theorem

Theo Under a proper modification of the initial approximation at t = 0, we have, with  $\xi^N = \Gamma^N$  (resp.  $Z^N$ ) and  $\zeta = \mu g$  (resp. g)

$$P\Big(\mathbb{W}_{\psi}(\xi^{N},\zeta)\geq Cw_{N}\wedge N^{-1/2}(\|\psi\|_{\infty}\|\psi\|_{1})^{1/2}+u\Big)\leq \varepsilon_{N}(\psi,u)$$

with 
$$arepsilon_{\sf N}(\psi, u) = {\sf C}'ig({\sf e}^{{\sf C}''{\sf N}u^2(\|\psi\|_\infty\|\psi\|_1)^{-1}}-1ig)^{-1}$$
 .

▶ yields proper tools to study the deviation of  $\widehat{g}_{N,h}^{fin}(t,a) - g_h(t,a)$  and  $\widehat{\mu}_{N,h}^{fin}(t,a) - g_h(t,a) \rightsquigarrow$  adaptation.

## Oracle inequalities

► Goldenschluger-Lepski  $\rightsquigarrow$  data driven bandwidth  $\hat{h}_N$  and  $\hat{h}_N$ . Theorem (Oracle inequality) We have, for any  $(t, a) \in D_L \cup D_U$ 

$$\mathbb{E}\big[\big(\widehat{f}_{\mathcal{N}}(t,a)-f(t,a)\big)^2\big] \leq C \inf_{\kappa} \mathbb{E}\big[\big(\widehat{f}_{\mathcal{N},\kappa}(t,a)-f(t,a)\big)^2\big] + \delta_{\mathcal{N}},$$

with  $\widehat{f}_N = \widehat{g}_{N,\widehat{h}_N}^{\text{fin}}$  (resp.  $\widehat{\mu}_{N,h,h}^{\text{fin}}(t,a)$ ) and f = g (resp.  $\mu$ ) and  $\kappa = h$  (resp. (h, h)), where  $\delta_N = O(N^{-1})$  up to a constant depending on  $b_{\max}, \mu_{\max}, T, \phi$ .

 Adaptation over appropriate domains according to the preceding results.

# Some numerical illustration

 µ(t, a) = 410<sup>-4</sup> exp(810<sup>-3</sup>a), b =, φ(a)da ∼ N(60, 20<sup>2</sup>) conditioned upon [0, 120].

Figure: Unknown g. X-axis: time (0 to 100 years), Y-axis: age (0 to 120 years).

## Some numerical illustration

- $N = 10^3, 510^3, 10^4, 210^4, 510^4, 10^5$  over 10 MC samples.
- $K^{(1)} = K^{(2)} =$  Gaussian kernel.
- ► Calibration parameters... !

Figure: Rate estimation of g(t, a).  $(t, a) = (40, 60) \in \mathcal{D}_U$  (left) and  $(t, a) = (60, 90) \in \mathcal{D}_L$  (right). Green = True, Blue = Oracle, Red = estimator via GL.

# Conclusion: needed improvements

#### s

- Complete minimax optimality (~>> shed light on the anisotropic structure).
- Study the birth rate estimation b(t, a) (inverse problem) → ill - posed. Modification of the problem.
- Generalisation to other transports and some interactions ?

Generalisations: arbitrary transport + interactions

Can we extend our results to dynamics of the form

$$\begin{cases} \frac{\partial}{\partial t}g(t,a) + \frac{\partial}{\partial a}(v(a)g(t,a)) + \\ + (\mu(t,a) + \int_{\mathbb{R}_+} U(a,y)g(t,y)dy)g(t,a) = 0, \\ g(0,a) = \phi(a), \ g(t,0) = \int_{\mathbb{R}_+} b(t,a)g(t,a)da \end{cases}$$

In particular, can we build consistent tests for detecting the presence of an interaction?

Age dependent model Size model: estimation at a large fixed time in a proxy model

Large population models

Nonlinear extensions, open questions Models of interacting neurons

More non-linear models in a mean-field limit

# A model of interacting neurons

- Modelling the evolution of the electrical potentials of a system of N spiking neurons.
- De Masi *et al.* (2015), Löcherbach and Fournier (2015) following De Masi and Galvez (2013).
- ► Each neuron spikes randomly with rate *B*(*u*) depending on the membrane potential *u* of the neuron.
  - 1. At spiking time,
    - Spiking membrane is reset to a resting potential (here u = 0).
    - Action of chemical synapses increases the potential of other neurons by  $N^{-1}$ .
  - 2. Action of electrical synapses synchronises the potentials of the system.
- We model the distribution of membrane potentials of a system of N neurons through time.

Example 4: a model of interacting neurons

(U<sub>i</sub>(t))<sub>1≤t≤N</sub> = the membrane potentials at time t.
 Z<sup>N</sup><sub>t</sub> = N<sup>-1</sup> ∑<sup>N</sup><sub>i=1</sub> δ<sub>U<sub>i</sub>(t)</sub>.

Associated SDE

$$\begin{split} Z_t^N &= \phi_{Z_0^N}(t) \\ &+ \frac{1}{N} \int_0^t \sum_{i=1}^N \int_{0 \le \theta \le B(u_i(Z_{s-}^N))} \left( \delta_{\phi_0(t-s)} - \delta_{\phi_{u_i(Z_{s-}^N)}(t-s)} \right) Q^i(ds, d\theta) \\ &+ \frac{1}{N} \int_0^t \sum_{i=1, j \ne i}^N \int_{\theta \le B(u_j(Z_{s-}))} \left( \delta_{\phi_{u_i(Z_{s-}^N)+N^{-1}(t-s)}} - \delta_{\phi_{u_i(Z_{s-}^N)}(t-s)} \right) Q^j(ds, d\theta). \end{split}$$

(Q<sup>i</sup>)<sub>1≤i≤N</sub> independent Poisson measures, intensity ds ⊗ dθ.
 φ<sub>∑iδui</sub>(t) = ∑i δ<sub>φui</sub>(t).

Example 4: a model of interacting neurons

• Mean-field limit  $N \to \infty$ .

- ► Example 4.1: The simplest case when synchronization is ignored: φ<sub>u</sub>(t) = u for every t ≥ 0.
- If  $Z_0^N \approx g_0(u) du$ , then  $Z_t^N(du) \approx \xi_t(du) = g(t, u) du$ .
- g(t, u) weak solution to the nonlinear evolution equation

$$\begin{cases} \frac{\partial}{\partial t}g(t,u) + \langle g(t,\cdot), B \rangle \frac{\partial}{\partial u}g(t,u) + B(u)g(t,u) = 0, \\ g(0,u) = g_0(u), g(t,0) = 1. \end{cases}$$

The nonlinearity in the limiting model reflects the interactions of the individuals.

# Example 4.2: a model of interacting neurons with stochastic flow

• Case of a stochastic flow  $\frac{d}{dt}\phi_x(t) = \kappa(\phi_x(t), Z_t^N)dt$ , with mean-reverting

$$\kappa(x, Z_t^N) = -\lambda(x - Z_t^N), \ \lambda \ge 0.$$

• If 
$$Z_0^N \approx g_0(u) du$$
, then  $Z_t^N(du) \approx \xi_t(du) = g(t, u) du$ .

• g(t, u) weak solution to the evolution equation

$$\begin{cases} \partial_t g + (\langle g(t, \cdot), B \rangle - \lambda u) \partial_u g + (B(u) - \lambda)g = 0, \\ g(0, u) = g_0(u), \ g(t, 0) = \frac{\langle g(t, \cdot), B \rangle}{\langle B + \lambda \cdot, g(t, \cdot) \rangle}. \end{cases}$$

# Example 4.1 and 4.2: identification of the objects of interest

We can identify the following objects

- $N \to \infty$ .
- $Z^N$  is  $(Z_t^N)_{0 \le t \le T}$  and we observe  $\mathcal{Z}^N = Z^N$  or a uniform sample of size  $n \ll N$  extracted from  $Z^N$ .
- f is  $(t, u) \mapsto g(t, u)$  or  $x \mapsto B(u)$ .
- $\mathcal{H}^N$  and  $\mathcal{H}$  are the SDE and the nonlinear transport evolution equation.

Observation schemes

More non-linear models in a large population model

- Interaction between particles can play at various levels. We elaborate briefly on three more examples.
- Example 3.2: Birth-and-death processes with population dependent death rate.
- ► Example 5: Interacting Hawkes processes.
- Example 6: The McKean-Vlasov model and the effect of diffusion.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Example 3.2: nonlinear death rate in population models

• In Example 3, we replace the death rate B(t, a) by

$$B(t,a,Z_t^N) = B(t,a) + \int_{\mathbb{R}_+} U(a,a')Z_t^N(da')$$

for some kernel  $U : \mathbb{R}_+ \times \mathbb{R}_+ \to \mathbb{R}_+$ .

- The kernel U accounts for some population dependent pressure on the death rate.
- If  $Z_0^N \approx g_0(a) da$ , then  $Z_t^N(da) \approx g(t, a) da$ .
- g(t, a) weak solution of the nonlinear evolution equation

$$\begin{cases} (\partial_t + \partial_a)g(t, a) + (B(t, a) + \int_{\mathbb{R}_+} U(a, a')g(t, a'))g(t, a) = 0, \\ g(0, u) = g_0(u), \quad g(t, 0) = \int_0^\infty b(t, a)g(t, a)da. \end{cases}$$

# Example 5: interacting Hawkes processes

- We consider a system of point processes interacting through their jump intensities.
- Point process:  $N_t = \sum_{i \ge 1} \mathbf{1}_{\{T_i \le t\}}$  where

 $T_0 = 0 \le T_1 < T_2 < \ldots < T_i < \ldots$  jump times

- Simplest example: Poisson process with intensity  $\lambda > 0$ :
  - The  $T_i T_{i-1}$  are independent and  $Exp(\lambda)$  distributed.
  - Alternative representation:

$$N_t = \int_0^t \int_{0 \le \theta \le \lambda} Q(ds, d\theta)$$

*Q*: Poisson random measure with intensity  $ds \otimes d\theta$ .

# Example 5: univariate Hawkes processes

Nonlinear Hawkes processes: replace λ by a random past dependent stochastic intensity

$$\lambda_t = h \big( \lambda + \int_0^{t-} \varphi(t-s) dN_s \big),$$

- $h : \mathbb{R} \to \mathbb{R}_+$  (h(x) = x: linear Hawkes processes.)
- $\varphi : \mathbb{R} \to \mathbb{R}$  causal interacting kernel:  $\operatorname{Supp}(\varphi) \subset \mathbb{R}_+$ .

• Interpretation: with  $\mathcal{F}_t = \sigma(N_s, s \leq t)$ ,

$$\mathbb{P}(N_{t+dt} - N_t \geq 1 | \mathcal{F}_{t-}) = \lambda_t dt.$$

Alternative representation as a SDE:

$$N_t = \int_0^t \int_{0 \le heta \le h\left(\lambda + \int_0^{s-} \varphi(s-u) dN_u
ight)} Q(ds, d heta).$$

Example 5: interacting Hawkes processes

System of nonlinear Hawkes processes: defined by the family of SDE: for i = 1,..., N,

$$N_t^i = \int_0^t \int_{0 \le \theta \le h\left(\lambda + N^{-1} \sum_{j=1}^N \int_0^{s-} \varphi(s-u) dN_u^j\right)} Q^i(ds, d\theta),$$

 $Q^i$  ind. Poisson, intens.  $ds \otimes d\theta$ .

• 
$$Z_t^N = N^{-1} \sum_{i=1}^N \delta_{N_t^i}.$$

- Mean-field limit:  $Z_t^N(ds) \approx g(t, ds)$  as  $N \to \infty$ .
- g is a weak solution of

$$igg(\partial_t g(t,s) + higl(\int_0^t arphi(t-u)dm_uigr)igl(g(t,s) - g(t,s-1)igr) = 0,$$
  
 $igl(g(0,s) = \delta_0(ds), m_t = \int_0^t higl(\int_0^s arphi(s-u)dm_uigr)ds.$ 

#### Example 6: McKean-Vlasov model

► System of *N* interacting diffusion processes :

$$dX_t^i = -b(X_t^i)dt - N^{-1}\sum_{j=1}^N U(X_t^i - X_t^j)dt + \sigma dB_t^i, \ i = 1, \dots, N,$$

 $B_t^i$  ind. Brownian motions.

• 
$$Z_t^N = N^{-1} \sum_{i=1}^N \delta_{N_t^i}$$

- Mean-field limit: if  $Z_0^N(dx) \approx g_0(dx)$ , then  $Z_t^N(dx) \approx g(t, x) dx$ .
- g(t, s) is a weak solution to the McKean-Vlasov equation

$$\begin{cases} \partial_t g(t,x) + \partial_x g(b + U \star g) = \frac{\sigma^2}{2} \partial_x^2 g, \\ g(0,x) = g_0(dx). \end{cases}$$
